

# Feline Ophthalmic

## CASE REPORT

Cat was presented with a deep corneal ulceration due to a fight wound. The veterinarian sutured in a Vetrix ECM Ocular Disc extending 1mm beyond the outer perimeter of the corneal. The veterinarian sutured this in place with 8.0 PDS and kept the material moist with Chloramphenicol eye ointment.

Healing begins at the corneal edges and works its way towards the center.

This is the same eye 10 weeks after placing Vetrix ECM Ocular Disc.
